STUD FINDER

1 Determine the location for your new shelf. We recommend placing a piece of painter's tape in the desired location so you can get a "feel" for its new home.

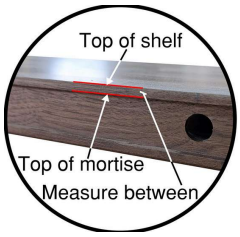

2 While someone holds your shelf in the desired location, mark top, left and right edge of where the shelf will be. Very short lines will be sufficient.

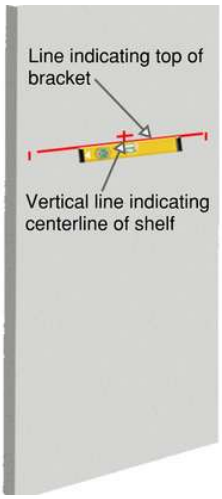

3 Measure the back of your shelf from the top of the shelf to the top edge of the mortise pocket. From the line you marked in the previous step, measure down this same distance. Using a level and pencil, draw a horizontal line connecting the left and right ends of the shelf location you marked in the previous step. Finally, draw a short vertical line to mark the center of the shelf.

Back of shelf

4 Using your stud finder, mark both the left and right side of each stud that lies along your horizontal line indicating the top of your shelf bracket.

5 Place the bracket on the wall directly below the horizontal line, aligning the bracket centerline with the shelf centerline. While holding the bracket in place, use the supplied drill bit to drill holes through the top of the bracket and into each wall stud. Drive one of the supplied screws into each newly drilled hole. If space allows, drill a second hole through the bottom of the bracket into each stud and secure it with an additional supplied screw.

6 Align the shelf holes with the bracket rods and slide the shelf into place. If needed, gently tap the shelf toward the wall with your palms until fully seated.
